

Recall from last class:

- If A is an $n \times n$ matrix, then $\lambda \in \mathbb{R}$ is an **eigenvalue** of A if there exists a non-zero vector v , called an **eigenvector** corresponding to λ , such that

$$Av = \lambda v.$$

- If λ is an eigenvalue of an $n \times n$ matrix A , then the set of all solutions v to $Av = \lambda v$ is the **eigenspace** of A corresponding to λ .
- **Theorem 1:** The eigenvalues of a triangular matrix are the diagonal entries.
- **Theorem 2:** If $v_1, \dots, v_p$ are eigenvectors corresponding to distinct eigenvalues $\lambda_1, \dots, \lambda_p$ of an $n \times n$ matrix A , then $v_1, \dots, v_p$ are linearly independent.
- If A is an $n \times n$ matrix, then the characteristic polynomial of A , denoted by $p_A(\lambda)$, is given by

$$p_A(\lambda) = \det(A - \lambda I_n).$$

- λ is an eigenvalue of an $n \times n$ matrix A if and only if λ is a zero of the characteristic polynomial.
- If A and B are similar matrices, then they have the same characteristic polynomials and hence the same eigenvalues (with the same algebraic multiplicities).

1. Let $A = \begin{bmatrix} 1 & 1 \\ -2 & 4 \end{bmatrix}$. Find eigenvalues and eigenspaces of A .

Definition 1. An $n \times n$ matrix A is **diagonalizable** if A is similar to a diagonal matrix.

Diagonalization Theorem: An $n \times n$ matrix A is diagonalizable if and only if A has n linearly independent eigenvectors. Moreover, $A = PDP^{-1}$ with D diagonal if and only if the columns of P are n linearly independent eigenvectors of A . In this case the diagonal entries of D are the corresponding eigenvalues of A .

Definition 2. A basis of $\mathbb{R}^n$ diagonalizing A is called an **eigenbasis**.

2. Prove the Diagonalization Theorem.

3. Let $A = \begin{bmatrix} 1 & 3 & 3 \\ -3 & -5 & -3 \\ 3 & 3 & 1 \end{bmatrix}$ If possible, diagonalize A .

4. Let $A = \begin{bmatrix} 2 & 4 & 3 \\ -4 & -6 & -3 \\ 3 & 3 & 1 \end{bmatrix}$ If possible, diagonalize A .

Theorem 6: An $n \times n$ matrix A with n distinct eigenvalues is diagonalizable.

5. Prove the theorem.

Diagonalization— Answers / Solutions

1. In order to find the eigenvalues, we compute the zeros of the characteristic polynomial. Note $p_A(\lambda) = \det \begin{bmatrix} 1-\lambda & 1 \\ -2 & 4-\lambda \end{bmatrix} = (1-\lambda)(4-\lambda) + 2 = (\lambda-2)(\lambda-3)$. Thus the eigenvalues of A are 2 and 3. We find the eigenspaces for each now.

$\lambda = 2$. In this case, we get

$$A - 2I_2 = \begin{bmatrix} -1 & 1 \\ -2 & 2 \end{bmatrix} \sim \begin{bmatrix} -1 & 1 \\ 0 & 0 \end{bmatrix}.$$

Thus the eigenspace corresponding to the eigenvalue of 2 is given by

$$E_2 = N(A - 2I_2) = \text{Span} \left\{ \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right\}.$$

$\lambda = 3$. In this case, we get

$$A - 3I_2 = \begin{bmatrix} -2 & 1 \\ -2 & 1 \end{bmatrix} \sim \begin{bmatrix} -2 & 1 \\ 0 & 0 \end{bmatrix}.$$

Thus the eigenspace corresponding to the eigenvalue of 3 is given by

$$E_3 = N(A - 3I_2) = \text{Span} \left\{ \begin{bmatrix} 1 \\ 2 \end{bmatrix} \right\}.$$

Thus we get

$$A = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & 0 \\ 0 & 3 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}^{-1}.$$

2. *Proof.* We prove the reverse implication first.

$\Leftarrow$. Let $v_1, \dots, v_n$ be linearly independent eigenvectors with corresponding eigenvalues $\lambda_1, \dots, \lambda_n$. Define $P = [v_1 \ \dots \ v_n]$ and $D = \begin{bmatrix} \lambda_1 & 0 & \dots & 0 & 0 \\ 0 & \lambda_2 & \dots & 0 & 0 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \dots & 0 & \lambda_n \end{bmatrix}$. Then

$$\begin{aligned} AP &= A[v_1 \ \dots \ v_n] \\ &= [Av_1 \ \dots \ Av_n] \\ &= [\lambda_1 v_1 \ \dots \ \lambda_n v_n] \\ &= PD. \end{aligned}$$

Since P is invertible, we get $A = PDP^{-1}$, and hence A is diagonalizable.

$\Rightarrow$. Suppose $A = PDP^{-1}$ for some matrix P and some diagonal matrix D . Let $P = [v_1 \ \dots \ v_n]$ and let D be diagonal matrix with diagonal entries $\lambda_1, \dots, \lambda_n$. Since P is invertible, the Invertible Matrix Theorem gives $v_1, \dots, v_n$ are linearly independent. Thus we only need

to prove that $v_1, \dots, v_n$ are eigenvectors of A . Let $e_1, \dots, e_n$ denote the standard basis vectors for $\mathbb{R}^n$, then note $v_k = Pe_k$ and hence $P^{-1}v_k = e_k$. Thus

$$Av_k = PDP^{-1}v_k = PDe_k = P\lambda_k e_k = \lambda_k Pe_k = \lambda_k v_k.$$

Thus $v_1, \dots, v_k$ are eigenvectors of A with eigenvalues $\lambda_1, \dots, \lambda_k$. □

3. In order to find the eigenvalues, we compute the zeros of the characteristic polynomial. Note

$$p_A(\lambda) = \det \begin{bmatrix} 1-\lambda & 3 & 3 \\ -3 & -5-\lambda & -3 \\ 3 & 3 & 1-\lambda \end{bmatrix} = -(\lambda-1)(\lambda-2)^2. \text{ Thus the eigenvalues of } A \text{ are } 1$$

and -2 (with algebraic multiplicity 2). We find the eigenspaces for each now.

$\lambda = 1$. In this case, we get

$$A - I_3 = \begin{bmatrix} 0 & 3 & 3 \\ -3 & -6 & -3 \\ 3 & 3 & 0 \end{bmatrix} \sim \begin{bmatrix} 1 & 0 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix}.$$

Thus the eigenspace corresponding to the eigenvalue of 1 is given by

$$E_1 = N(A - I_3) = \text{Span} \left\{ \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} \right\}.$$

$\lambda = -2$. In this case, we get

$$A + 2I_3 = \begin{bmatrix} 3 & 3 & 3 \\ -3 & -3 & -3 \\ 3 & 3 & 3 \end{bmatrix} \sim \begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}.$$

Thus the eigenspace corresponding to the eigenvalue -2 is given by

$$E_{-2} = N(A + 2I_3) = \text{Span} \left\{ \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} \right\}.$$

Thus we get

$$A = \begin{bmatrix} 1 & -1 & -1 \\ -1 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & -2 \end{bmatrix} \begin{bmatrix} 1 & -1 & -1 \\ -1 & 1 & 0 \\ 1 & 0 & 1 \end{bmatrix}^{-1}.$$

4. In order to find the eigenvalues, we compute the zeros of the characteristic polynomial. Note

$$p_A(\lambda) = \det \begin{bmatrix} 2-\lambda & 4 & 3 \\ -4 & -6-\lambda & -3 \\ 3 & 3 & 1-\lambda \end{bmatrix} = -(\lambda-1)(\lambda-2)^2. \text{ Thus the eigenvalues of } A \text{ are } 1$$

and -2 (with algebraic multiplicity 2). We find the eigenspaces for each now.

$\lambda = 1$. In this case, we get

$$E_1 = N(A - I_3) = \text{Span} \left\{ \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} \right\}.$$

$\lambda = -2$. In this case, we get

$$E_{-2} = N(A + 2I_3) = \text{Span} \left\{ \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} \right\}.$$

Hence we have only two linearly independent eigenvectors and by the Diagonalization theorem, A cannot be diagonalized.
